## **MONITORING AND COMPLIANCE STATUS REPORT**

## MONITORING AND COMPLIANCE STATUS REPORT

EVENTDESCRIPTION

Completed Inspections = This value is calculated from the number of composite sample events, inspections of an industry when there was no discharge, and grab samples when not taken within one day after a composite sample.

Violation Notice = Indicates a company was sent a Notice of Violation for those constituents shown and corrective action is required. For major violations a non-compliance sampling fee was charged, while minor violation non-compliance sampling fees are at OCSD's option.

COMPLIANCE STATUS DEFINITIONS

NOTE: OCSD enforces on lbs/day and concentration for the same constituent when EPA does not. This may result in a different compliance status between quarterly and semi-annual.

Quarterly Status – The Quarterly Compliance Status incorporates only OCSD sample results for its determination.

CAC = Consistently achieving compliance (CAC). The company had no violations, or less than or equal to 10% of all the composite samples taken show violations for the same constituent.

IAC = Inconsistently Achieving Compliance (IAC). Does not meet the definition of CAC or NC.

NC = Non-compliant. More than or equal to 20% of all composite samples taken show violations for the same constituent. Concentration and pounds are calculated separately.

ID = Insufficient data. No composite sample data or no applicable limits were available to make a status determination.

\*\*\* = No OCSD analytical data.

Semi-Annual Status – The Semi-Annual Status is an EPA-related evaluation and incorporates both OCSD results and Permittees' self-monitoring results for its determination.

CAC = Consistently achieving compliance (CAC). The company had no violations.

IAC = Inconsistently achieving compliance (IAC). Does not meet the definition of CAC or SNC.

SNC = SNC status is defined below.

ID = Insufficient data. No applicable limits were available to make a status determination, or the company has not been in business for 6 months.

\*\*\* = No analytical data.

EPA Defined Significant Non-Compliance (SNC) – 40 CFR 403.8(f)(2)(viii)

SNC-A = Chronic violations. 66% or more of all samples taken during a six-month period exceed (by any magnitude) the daily maximum concentration or production-based pound limit for the same constituent.

SNC-B = Technical Review Criteria (TRC) violations. 33% or more of all sample concentrations or production-based pound limits for the same constituent taken during a six-month period equal or exceed the product of the daily maximum limit multiplied by the applicable TRC. TRC = 1.2 for heavy metals, cyanide and TTO.

SNC-C = The discharge has caused, alone or in combination with other discharges, interference or pass through.

SNC-D = OCSD issued a Cease and Desist Order or otherwise exercised its emergency authority to halt or prevent discharge.

SNC-E = Failure to meet, within 90 days after the scheduled date, a compliance schedule milestone for starting construction, completing construction, or attaining final compliance.

SNC-F = Failure to provide required reports including, but not limited to, periodic self-monitoring reports and reports with compliance schedules within 45 days of the due date.

SNC-G = Failure to accurately report non-compliance.

SNC-H = Any other violation or group of violations, which OCSD determines will adversely affect the implementation of the pretreatment program.

COMMENT DEFINITION - ENFORCEMENT ACTIONS

OOB = Company went out of business, terminated their regulated process flow, or OCSD removed them from the permit system.

2-Chlorophenol  
2,4-Dichlorophenol  
2,4-Dimethylphenol  
2,4-Dinitrophenol  
2-Methyl-4,6-Dinitrophenol  
2-Nitrophenol  
4-Nitrophenol  
Pentachlorophenol  
Phenol  
2,4,6-Trichlorophenol

## **GROUNDWATER REPLENISHMENT SYSTEM**

## SOURCE CONTROL FOR THE GROUNDWATER REPLENISHMENT SYSTEM

### INTRODUCTION

This technical appendix summarizes the Non-Industrial Source Control (NISC) program investigation, control of contaminants, and current Orange County Sanitation District (OCSD) and Orange County Water District (OCWD) source control activities related to GWRS. It describes specific activities related to the control of contaminants of historic and more recent interest, including n-Nitrosodimethylamine (NDMA), 1,3-dioxolane, 1,4-dioxane, and tritium.

### 1.0 NDMA

Between 2008 and 2011, NDMA in GWRS-Q1 feedwater was consistently been under the OCSD LOS of 150 ng/L, with the exception of a brief period early 2009 (Figure 1). OCSD staff suspected this exceedance was related to improper discharge of filtrate contaminated with dimethyl amine during OCSD digester cleaning operations. The source of the dimethyl amine was believed to be from the polymer chemical added to assist with centrifuge separation of residual solids during digester cleaning by an onsite contractor. Appropriate control measures were taken to prevent a recurrence. As reported in the GWRS Annual Report, in calendar years 2010 and 2011, the average GWRS-Q1 NDMA concentrations were 19 and 14 ng/L, respectively. However, as reported previously to the Panel and in the GWRS Annual Report, beginning in late June 2012, an increasing trend in GWRS-Q1 NDMA was observed during OCWD's regular weekly monitoring (Figure 1). Beginning on June 29, three out of four successive weekly GWRS-Q1 grab samples exceeded the OCSD LOS of 150 ng/L, with the July 20 grab sample registering 1,710 ng/L.

Figure 1: GWRS-Q1 NDMA Sampling Results, 2008-2014

## 1.1 Increased Monitoring and UV Dose

In response to these summer 2012 increases, OCWD initiated daily 24-hour composite sampling of GWRS-Q1 (Figure 2) and GWRS-FPW (Figure 3), which indicated decreases from the previous peak observed concentrations. OCWD also directed OCSD to begin a source control investigation under the jointly-developed response plan. Under this plan, OCSD began sampling its influent into Plant No.1 and Q1 to evaluate potential sources. As a precaution against additional NDMA increases affecting GWRS-FPW (Figure 4), OCWD also temporarily increased the energy dose of its UV/AOP system from the standard minimum equivalent of four of six reactors in each train to all six reactors at full power. Extra testing of GWRS-UVF and -UVP for NDMA and 1,4-dioxane was also conducted to confirm the effectiveness of the increased UV energy dose. The performance of the UV/AOP system was presented to the Panel in 2012 via a technical memorandum and presentation at the regular August meeting.

Figure 2: GWRS-Q1 NDMA 24-hr Composite Sampling Results, July 2012

Figure 3: GWRs-FPW NDMA 24-hr Composite Sampling Results, July 2012

Figure 4: GWRs-FPW NDMA Sampling Results, 2008–2014

Each sample that OCSD collected was a flow-proportioned sample over a 24 hour period at the influent to Plant No. 1 (P1-INF) and the GWRS-Q1. Two difference analytical methods were used, EPA Method 625 Base-Neutral (EPA 625) for wastewater with a method detection limit of 2,700 ng/L and a Time-of-Flight, Base-Neutral Purge and Trap (TOF) with a reporting limit which ranged over the sampler period of interest between 1 and 50 ng/L.

OCSD sample results are shown at P1-INF (Figure 5) from January 2012 to May 2012. There were 11 samples taken, all using TOF method. 9 of the 11 TOF samples were detect with a median value of 49 ng/L. The highest value measured at P1-INF was 260 ng/L on March 3, 2013.

**Figure 5: P1 Influent Flow-Proportioned Sampling Results, 2012–2013**

There were 10 samples analyzed at GWRS-Q1 (Figure 6) with all using TOF method. 8 of the 10 TOF samples were non-detect. The two samples where detects occurred had a median value of 15 ng/L and the highest value measure was 27 ng/L on March 3, 2013. The level of service at the GWRS-Q1 is 150 ng/L. All samples were below the level of service.

Since mid-2013, GWRS-Q1 NDMA concentrations have returned to their historical norm (Figure 1).

**Figure 6: P1 Effluent (GWRs-Q1) Flow-Proportioned Sampling Results, 2012–2013**

Note that the implied removal efficiency based on the March 3<sup>rd</sup> results is 90% from P1-INF to GWRs-Q1. The removal rate is based on operation of both activated sludge units in Nitrification-Denitrification mode (Mean Cell Residence Time of 7 to 8 days) as well as the Plant No. 1 trickling filter facility.

A comparison of the historic sample results shows that the average influent concentration of NDMA is 1.33 ng/L and the average concentration of 45.1 ng/L, suggesting that NDMA is being added inside of Plant No. 1 rather than coming in from the collection system (Figure 7).

**Figure 7: Comparison of P1 Influent Sample (OCSD) Results Versus P1 Effluent (GWRs-Q1), 2008–2014**

## 1.2 NDMA Precursor Study

Since the last panel meeting, OCSD and OCWD jointly conducted an NDMA precursor study. OCSD obtained wastewater and process chemical samples and OCWD conducted the laboratory analysis. The study focused on chemicals that are commonly used in relatively large volumes within OCSD P1 and found in the collection system.

The study began at the belt presses at P1, because in 2002, Los Angeles County Sanitation District shared analytical results on polymers with OCSD<sup>1</sup> showing that certain polymers used to enhance separation of water from sludge contain NDMA and precursors.

It is interesting to note that since the 2002 findings and before the 2008 start-up of the GWRS, OCSD acted to protect the GWRS by diverting the belt press filtrate flow away from the GWRS and to its P2 treatment plant in Huntington Beach. However, due to hydraulic limitations, belt press filtrate flows above 2 million gallons per day spill over a weir and are directed back to the P1 head works, and thus can affect GWRS.

Based on this understanding, the summer 2012 GWRS-Q1 NDMA analytical results provided by OCWD were plotted against the belt press filtrate flow rate daily averages that were greater than 2 MGD (Figure 8). It appears that flows above 2 MGD, with a few exceptions, appear to coincide with the NDMA spikes measure by OCWD at Q1.

**Figure 8: NDMA Initial Measurement and Formation Potential of Belt Press Filtrate**

Following this finding, samples were taken of OCSD P1 belt press filtrate and polymer chemicals being used to enhance settling at the belt presses. A description of those processes follow.

(mg/L)

<sup>1</sup> E-mail from Steve Carr, LACSD to Sam Mowbray, OCSD June 12, 2003.

- At Plant No. 1, sludge from the digester is sent to belt presses where the percent of solids is increased from an annual average of 2 percent to an annual average of 19 percent. Cationic (positively charged) polymer is used for this unit process which includes Mannich and emulsion polymers. During FY 2013/14, 73,000 gallons of cationic solution was used at P1 for dewatering, of which 47,500 gallons is Mannich and 1,100 is emulsion. The remaining 24,400 gallons was used at the Dissolved Air Floatation Thickeners.
- Anionic (negatively charged) polymer is typically used with ferric chloride to chemically enhance primary treatment. The anionic polymers remove heavy metals from the wastewater. During FY2013/14, 32,900 gallons of anionic solution was used at P1 of which 32,500 is solution polymer and 400 is emulsion polymer.

Samples of the belt press filtrate were collected at OCSD P1 and analyzed by the OCWD Lab. At the start of sampling, the polymers were analyzed for initial NDMA concentration. Since the last NWRI GWRS advisory panel meeting, the OCWD Laboratory adopted panel recommendations and implemented a formation potential analysis which includes a shorter 7-day incubation period.

All samples collected of the belt press filtrate tested positive for NDMA as an initial measurement and for additional NDMA formed over a 7-day formation potential incubation period with chlorine addition (Figures 9 and 10). Initial NDMA concentrations ranged from 15.2 to 60.8 ng/L and formation potential results ranged from 206 to 1,010 µg/L for grab samples. Subsequently, three consecutive 24-hour time composited samples of the belt press filtrate were taken and the initial NDMA concentration results ranged from 12.0 to 60.1 ng/L<sup>2</sup>. Formation potential results ranged from 21,700 to 913,000 ng/L. For reference, recall that the NDMA level of service at Q1 is 150 ng/L and the CDPH drinking water notification level is 10 ng/L.

Since belt press filtrate samples tested positive for NDMA, samples were taken of polymers used at P1. Results (Figure 11) indicate that NDMA is detected in both anionic and cationic polymers. Initial detects results show significantly higher initial NDMA detected in the cationic polymer. Formation potential results show that both anionic and cationic polymers will form additional NDMA from precursors present in the polymer solution with the addition of chlorine. However, the cationic polymer forms a significantly higher concentration of NDMA.

The variability in analytical results from the polymer samples is enough to warrant further testing to confirm whether NDMA concentration variability is a result of

- type of polymer being used, e.g., cationic, ionic
- chemical manufacturer batch or lot number
- dry mix or pre-mix

### 1.3 Conclusions and Other Observations

The proposed path forward with respect to NDMA source control includes:

- Development of joint-agency strategy on GWRS-Q1 sample collection method, sampling frequency, and analytical method
- Work with OCSD Process Engineering to identify substitute polymer
- Develop a screening program for OCSD/OCWD process chemicals
- Work with cities to identify opportunities to test other root control products for Pollutants of Concern (POCs)
- Identify other industrial sources of NDMA
- NISC to evaluate NDMA for a local limit

<sup>2</sup> Based on the second set of values of duplicate analytical results.

## 2.0 1,3-DIOXOLANE

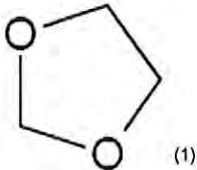

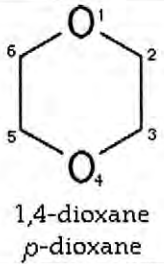

In December 2013, an industrial wastewater discharger had reported to OCSD that it fully phased out 1,4-Dioxane and was using 1,3-Dioxolane as a substitute for membrane manufacturing as of 6 months prior to reporting.

OCSD notified OCWD of the switch and discussed potential impacts and path forward.

### 2.1 Comparison of 1,3-Dioxolane with 1,4-Dioxane

1,3-dioxolane is similar in properties to 1,4-dioxane (Table 1), with similar human health toxicity effects, although the toxicological domain for 1,4-dioxane is better developed in comparison.

**Table 1: 1,3-Dioxolane and 1,4-Dioxane Properties and Human Health Data**

## 2.2 Regulatory Approach

In consideration of the similar properties and toxicity, both agencies agreed that the discharger would be regulated under the same restrictions as the original permit for 1,4-dioxane to protect the GWRS.

The discharger operates under a Class 1 non-categorical permit with an interim local limit derived from the CDPH drinking water notification level for 1,4-dioxane, technical removal efficiency, growth factor and safety factor in accordance with EPA local limits guidance.

## 2.3 Path Forward

In June 2014, OCWD began a study to benchmark the removal efficiency of 1,3-dioxolane across the GWRS unit processes in their research stations. Preliminary pilot results (table 2) show that the removal efficiency for 1,3-dioxolane is 65% (no removal by RO and 65% removal by AOP). In contrast, the removal efficiency for 1,4-dioxane is 96% (86% removal by RO and 74% removal by AOP).

**Table 2: 1,3-Dioxolane and 1,4-Dioxane Initial Study Results (n = 1)**

Site	1,3-dioxolane (ug/L)	1,4-dioxane (ug/L)
Q1	0.035	1.067
ROF	0.059	1.234
ROP	0.069 (No removal by RO)	0.168 (86% removal by RO)
UVF	0.048	0.170
UVP	0.017 (65% removal by AOP)	0.045 (74% removal by AOP)

Because the preliminary results show that 1,3-dioxolane has the potential to pass through treatment at a higher rate than 1,4-dioxane, more data points are needed to establish a technical basis for local limits. OCWD will be developing more datasets similar to Table 2 in its pilot study. The removal rates will be used to establish protective discharge limits.

## 2.4 1,4-Dioxane Update

During the 2012 to 2013 timeframe, 1,4-dioxane concentration spikes were measured in the GWRS feed water at Q1. The feed water is secondary treated effluent from Reclamation Plant No. 1. During this

time, OCSD's Non Industrial Source Control (NISC) group implemented an investigation to identify the discharge sources and mitigate the spikes (Figure 12).

The investigation identified multiple industrial sources discharging 1,4-dioxane. In total, OCSD took enforcement actions with seven companies.

**Figure 12: 1,4-Dioxane Occurrence for the GWRS Feed Water at Q1**

Recent monitoring results (Figure 12) indicate that the 1,4-dioxane concentration spikes measured at Q1 continue to reduce in frequency and concentration/mass. The levels from January, 2013 to 2014 are reflective of the background levels measured from January 2008 to 2009.

### 3.0 TRITIUM UPDATE

#### 3.1 GWRS Final Product Water Monitoring

Figure 13 presents an updated time series of tritium concentrations in GWRS Final Product Water (GWRS-FPW) based on both grab and 24-hour composite samples. Generally lower concentrations have been detected since the spikes of July 2009 and July 2010, despite significantly increased monitoring frequency. Consistent with the NWRI Independent Advisory Panel's recommendation, regular weekly 24-hour composite sampling was performed in calendar year 2012, with the day of the week rotating during the year. Given that no 2012 sample result, grab or composite, exceeded the California Department of Public Health (CDPH) Detection Limit for the Purposes of Reporting (DLR) of 1,000 picocuries per liter (pCi/L), the 24-hour composite sampling has been reduced to monthly in 2013 to supplement the GWRS permit-required quarterly grab sampling. Since 2012, only three of 80 grab and composite samples collected have exceeded the California Office of Environmental Health Hazard Assessment's (OEHHA) non-enforceable Public Health Goal (PHG) of 400 pCi/L, and none since June 2012. The GWRS permit limit and drinking water maximum contaminant level (MCL) for tritium is 20,000 pCi/L. As such, the tritium sewer discharge control measures taken by the CDPH Radiologic Health Branch at the request of OCSD and OCWD may have had some effect in mitigating tritium spikes and results continue to remain at background levels.

Figure 13: Tritium Results of the GWRS Final Product Water

### 3.2 Groundwater monitoring

Figure 14 shows time series tritium data collected from a monitoring well located downgradient of the Talbert Barrier. The effects of the July 2009 and July 2010 GWRS-FPW tritium increases are evident in the well and are consistent with previously estimated travel times away from the Talbert Barrier. In general, a decreasing concentration trend with increasing distance away from the Barrier is observed in this monitoring well data. This is consistent with the attenuation expected via dispersive transport of relatively small periods and/or volumes of GWRS-FPW injection with elevated tritium within the aquifer, as well as the radioactive decay of tritium (half-life = 12.32 years). No significant post-July 2010 impacts to groundwater are evident, consistent with the decreased concentrations observed in GWRS-FPW.

**Figure 14: Tritium Concentration Downgradient of Talbert Barrier**

Less significant impacts to groundwater are evident in time series tritium plot from another monitoring well (Figure 15) located downgradient of Kraemer Basin where GWRS water is infiltrated. This is due to greater subsurface dispersion and mixing with other recharge sources (e.g., imported MWD water, Santa Ana river water) infiltrated in this area.

**Figure 15: Tritium Concentration Downgradient of Kraemer Basin**

There have been no observed impacts to the groundwater since 2010.

## PROOF OF PUBLICATION

### PUBLIC NOTICE

In accordance with the public participation requirements of 40 CFR Part 25 in the enforcement of National Pretreatment Standards and as defined by 40 CFR 403.8(f)(2)(vii), the Orange County Sanitation District (OCSD) is hereby publishing the following list of permittees who, during July 1, 2013 through June 30, 2014, were identified as industries in significant noncompliance with wastewater discharge standards. An industry in significant noncompliance is defined as follows:

- Chronic violations of discharge limits occurring when 66% or more of all measurements exceed the discharge limits for the same pollutant.
- Acute violations of discharge limits occurring when 33% or more of all measurements are a major violation of the discharge limits.
- Failure to provide required reports including, but not limited to, periodic self-monitoring reports and reports with compliance schedules within 45 days of the due date.
- Failure to accurately report noncompliance with discharge limits or any other requirements applicable to the user pursuant to OCSD's Wastewater Discharge Regulations (Ordinance).
- Any other violation or group of violations, which OCSD determines will adversely affect the implementation of the pretreatment program.

OCSD has taken enforcement action against these permittees. The majority of the permittees listed below have implemented adequate corrective actions and may be in compliance with the wastewater discharge standards as of the date of this publication.

Company Name	Permit No.	Category	City
<b>Industries SNC Due to Discharge Violations</b>			
Alexander Oil Co.	55-1-185	Local - CSDOC	Huntington Beach
Alcoa Global Fasteners, Inc.	2-1-091	Metal Finishing PSES + Aluminum Forming	Fullerton
